

SGSUP COLLOQUIUM LECTURE SERIES

Unlocking Real Estate Data for Climate and Built-Environment Research

Friday, Oct. 23

11 AM- 12:30 PM

COOR 5536

About the talk

Real estate data can reveal far more than property values. In this talk, Yoonjung Ahn will highlight a series of studies that use property records to uncover patterns of climate adaptation and long-term changes in the built environment. Ahn will discuss the development of U.S. air-conditioning prevalence datasets to understand heat vulnerability, as well as historical settlement datasets reconstructed from real estate records. Together, these projects demonstrate how unconventional data sources can open new avenues for studying climate, the environment and society.

Yoonjung Ahn

Assistant Professor
University of Kansas

About the speaker

Yoonjung Ahn is a health and medical geographer with extensive experience in multidisciplinary quantitative research, spanning both her educational journey and professional career. She uses spatial modeling, spatial analysis, spatial statistics and big data methodologies to investigate how environmental hazards affect human health and well-being.

ASU School of Geographical Sciences and Urban Planning
Arizona State University

Open to all ASU students, faculty and staff online.
Grad students: Join speakers for coffee & pastries, 10–10:30 AM.
